EDUCATION

B.S. in Computer Science, Cum Laude | GPA: 3.51

Graduated: May 2026

Texas State University, Minor: Data Analytics

Relevant Coursework: Data Analytics | Data Mining | Machine Learning | Artificial Intelligence | Data Analysis & Visualization

Industry Exposure: BOBCATshadow Program - Dell Technologies & Charles Schwab (enterprise SDLC, Agile)

TECHNICAL SKILLS

Languages: Python, SQL, JavaScript, TypeScript

Frameworks & Libraries: Next.js, React.js, FastAPI, CrewAI, Pydantic, Tailwind CSS

Databases & Tools: Supabase, PostgreSQL, SQLAlchemy, SQLite, REST APIs, OpenAPI, Git, GitHub, Redis, Docker, Vercel, GitHub Actions

Testing, ML & Data: pytest, Hypothesis, Vitest, scikit-learn, pandas, NumPy, Gemini API

PROJECTS

DebtPilot [Demo](#) | Next.js, TypeScript, Python, FastAPI, Pydantic, Vercel

- Built and deployed a privacy-first debt payoff planner that compares Snowball, Avalanche, and Minimums Only strategies and suggests affordable ways to accelerate payoff.
- Engineered a deterministic, cent-accurate amortization engine with Python Decimal, bounded simulations, explainable recommendations, and weekly, biweekly, monthly, and annual income normalization.
- Validated 249 backend and 73 frontend tests with 99.08% backend branch coverage; deployed the Next.js and FastAPI apps as separate Vercel services with GitHub Actions CI and generated TypeScript types from OpenAPI to prevent contract drift.

GOLAZO - AI World Cup Briefing Engine [Demo](#) | Python, CrewAI, Gemini API, Pydantic, FastAPI, Redis

(Upstash), GitHub Actions

- Shipped a production AI web app that generates fan-facing World Cup match briefings from live web data by orchestrating a three-agent CrewAI pipeline over Gemini grounded search.
- Guaranteed structured-output integrity across three LLM handoffs by enforcing Pydantic data contracts at every agent and tool boundary.
- Cut repeat-request latency from about 12 minutes to 0.2 seconds and fixed daily LLM cost by designing a two-tier cache and a scheduled GitHub Action that pre-generates each day's real fixtures.
- Sustained availability through provider quota and congestion outages by implementing two-level model fallback chains, retry sweeps, and lockfile-pinned deterministic deploys.

AniMood [Demo](#) | JavaScript (React), Supabase (PostgreSQL), Google GenAI SDK, Jikan API

- Built an AI recommendation feature that converts conversational text into actionable search parameters by using the Google GenAI SDK to construct Jikan REST API queries.
- Engineered a scalable backend architecture using Supabase, designing a normalized PostgreSQL schema to manage secure user authentication, session state, and profiles.
- Optimized Jikan REST API data fetching with a custom 400ms debounce on real-time search queries, reducing network payloads and preventing rate-limiting.
- Collaborated across a four-person team using Git and GitHub, conducting peer code reviews and maintaining branch discipline throughout development.

WORK EXPERIENCE

Interim Team Lead & Fulfillment Pace Setter

Cypress, TX

Target

Aug. 2022 - Present

- Acted as Interim Team Lead for over a year, directing a cross-functional fulfillment team of 15+ employees and establishing performance standards to optimize daily order throughput.
- Assumed core management responsibilities in the absence of leadership, streamlining resource allocation, device tracking, and communication pipelines to eliminate workflow bottlenecks.
